Shipment QA/QC is the process of comparing actual specimens in a shipping container to the specimen that is expected in that container position by LDMS. This should be done for shipments before they are sent and after they are received.

QA/QC is performed by scanning or comparing each specimen’s label with the expected specimen information, and indicating if it is correct or incorrect.

**Manual QA/QC:**
Manually compare the global specimen ID on the screen with the global specimen ID on the specimen label. If they match, click **Pass Specimen**, otherwise click **Fail Specimen**.

**Barcode Scanner QC/QC:**
Scan the specimen barcode on the specimen label. LDMS will record the global specimen ID. LDMS will **Pass** or **Fail** the specimen based on the global specimen ID match.
