The use of FSTRF-defined Preloads for available protocols makes it easier for laboratory staff to enter samples into LDMS by pre-populating the specimen entry screen with expected specimens. Specimen information is preloaded based on the protocol-defined collections which are detailed in Section 4 of the protocol Lab Processing Chart (LPC).

Preloads

The preload will be triggered by entering study and/or visit information in the participant grid. The trigger criteria can be found under the evaluation entry in section 4 of the LPC. When the user moves or tabs off of the Visit Unit field the preload menu will appear.

In some studies the preloads are not linked to a specific visit and will trigger when the user moves or tabs off of the Protocol field. There may be more than one preload in the list, check you have the correct preload highlighted and click OK in the preload menu.
